Canadian Data Report of Fisheries and Aquatic Sciences

Data reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of data reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was introduced with the publication of report number 161.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

Rapport statistique canadien des sciences halieutiques et aquatiques

Les rapports statistiques servent à classer et à archiver les compilations de données pour lesquelles il y a peu ou point d'analyse. Ces compilations auront d'ordinaire été préparées à l'appui d'autres publications ou rapports. Les sujets des rapports statistiques reflètent la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences aquatiques et halieutiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les numéros 1 à 25 de cette série ont été publiés à titre de relevés statistiques, Services des pêches et de la mer. Les numéros 26 à 160 ont été publiés à titre de rapports statistiques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 161.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

ABSTRACT

Bravender, B. A., C. Annand, A. Hillaby, and J. Naylor. 1997. Fish species, juvenile chinook diets and epibenthos in the Englishman River estuary, 1993. Can. Data Rep. Fish. Aquat. Sci. 1021: 41 p.

As part of a joint study of the Englishman River estuary in 1993, samples of the fish community were collected with beach and stick seines on eight sampling trips between May 3 and July 30. Eighteen sites in the estuary and surrounding nearshore area were assessed. Temperature and salinity at each site were recorded and triplicate samples of the epibenthos were taken at six of the sites. Fifteen species of fish were identified from the estuary including juvenile chum and chinook salmon. Lengths, weights and diet were determined for the chinook captured and scale samples were also preserved and read by the Ageing Laboratory at the Pacific Biological Station in Nanaimo.

RÉSUMÉ

Bravender, B. A., C. Annand, A. Hillaby, and J. Naylor. 1997. Fish species, juvenile chinook diets and epibenthos in the Englishman River estuary, 1993. Can. Data Rep. Fish. Aquat. Sci. 1021: 41 p.

Dans le cadre d'une étude conjointe réalisée en 1993 sur l'estuaire de l'Englishman, nous avons prélevé des échantillons de la communauté ichtyenne à l'aide de sennes de plage et de sennes à perches lors de huit campagnes d'échantillonnage menées entre le 3 mai et le 30 juin. Dix-huit sites ont été évalués dans l'estuaire et dans les eaux proches de la côte. À chaque site, nous avons enregistré la température et la salinité, et nous avons prélevé en trois exemplaires des échantillons de l'épibenthos à six des sites. Quinze espèces de poissons ont été identifiées dans l'estuaire, parmi lesquelles des juvéniles de kéta et de quinnat. Nous avons établi la longueur, le poids et le régime alimentaire des quinnats capturés, et envoyé des échantillons d'écailles au laboratoire de la Station de biologie du Pacifique, à Nanaimo, qui les a préservés et a déterminé l'âge des spécimens.

INTRODUCTION

The Englishman River drains into a small estuary on the east coast of Vancouver Island in the Strait of Georgia (Fig. 1). In April, 1993, this estuary and the surrounding nearshore habitat became part of the 873 hectare Parksville-Qualicum Beach Wildlife Management Area (Fig. 2). This area is now a protected preserve under the jurisdiction of the Wildlife Program (Vancouver Island Region) of BC Environment (Clermont, 1995).

Prior to the summer of 1993 knowledge of the biota of this estuary was very limited. In May a joint project was undertaken by a number of federal, provincial and private agencies to inventory the fish, vegetation, wildlife, birds, epibenthic and benthic invertebrates of this area.

The preliminary results of the initial survey may be found in Annand et al., 1993. A detailed description of the study area and analysis of the results are given in Bravender et al., 1996. Here we present the raw data on the temperatures, salinities, fish species distribution and abundance, juvenile chinook diets and epibenthos from the survey.

MATERIALS AND METHODS

Field Collections

The fish species at eighteen sites in the estuary and nearshore marine area were sampled during eight sampling trips made between May 3 and July 30, 1993 (Table 1). Samples were collected with either a beach seine 3 metres deep and 15.24 metres long (1.2 cm stretched mesh) or a stick seine 9.14 metres long from pole to pole with 5 mm mesh in the bunt. Duplicate sets were made with the beach seine and single sets were done with the stick seine. The sampling was usually carried out at low tide except for two evenings in July when beach seine sets were done at high tide at sites 7, 8, 17 and 18 (Fig. 1). The beach seine was set using a 5.5 m jet boat, a 3.7 m rowboat or on foot depending on the depth of the water. The stick seine was walked through shallow water up to approximately one metre deep. Sixty-nine beach seines and thirty stick seines were completed. The fish captured were counted and released, with ten of each group (salmon, sculpin etc.) from each site being preserved in 10% formalin and returned to the laboratory. Profiles to depth of salinity and temperature were recorded at all sites with a YSI Model 33 S.C.T. meter. Triplicate samples of the epibenthos were collected at six sites using a sampler first described by Sibert et al. (1977). This sled sampled the 10 cm of water immediately above the bottom and was drawn over a five metre transect close to shore in water that was approximately 1 m deep. The samples were preserved in a solution of 10% formalin and rose bengal.

Laboratory Analysis

In the lab, the fish were removed from the preservative and rinsed in fresh water. All fish captured were identified to species as described in Hart (1973) and Scott and Crossman (1973). Examples of each species were placed in a reference collection stored at the Pacific Biological Station in Nanaimo, B.C. Sixty-seven chinook and two chum were damp dried and weighed in water to the nearest 0.1 gram using a Mettler balance. The fork length to the nearest millimetre of each fish was also recorded. Scales were collected as smears on scale cards to verify species, document growth rate and search for "release" checks, which may indicate hatchery rather than wild origin.

Stomach analysis was carried out on sixty-two chinook. The stomachs from the esophagus to the anterior portion of the pyloric caecae were removed, damp dried and weighed to the nearest 0.001 gram with an Ohaus Model TP400D balance. The stomachs were then opened and the contents removed in a petri dish. A capacity estimate from 0 to 100% was made. The stomach wall was damp dried, re-weighed and the weight of the food bolus was calculated to the nearest 0.001 gram. The percent digestion of the stomach bolus was estimated and the contents were identified using a Wild M5 stereoscopic microscope. The length of each whole or undigested prey item was measured and the percent volume of each prey type was visually quantified. The percent of the bolus completely digested was also visually estimated and, if possible, the likely prey type was noted. The stomach contents were combined into ten groups (adult Diptera, adult insect other etc.) and the Index of Relative Importance (IRI) was calculated for each group as first suggested by Pinkas et al. (1971) and modified by Levy and Yesaki (1981). Values for IRI (reported in Bravender et al., 1996) were calculated for specific areas of the estuary as well as the estuary as a whole.

Sixty-six sled samples were analyzed in the lab using a dissecting microscope and plankton turntable. The preservative was decanted from the samples through a 30 μ sieve. All samples were scanned and the large organisms were counted and removed. If possible the sample was counted as a whole. Some samples were subdivided using a Folsom splitter. Where large numbers of organisms were collected water was added to bring the total volume of the sample to 250 ml and progressive aliquots were taken until 100 of the dominant organisms had been counted. These counts were then multiplied by the split factor to calculate the total number of organisms in the sample.

The tidal heights above chart datum and tidal stage at the time of sampling were calculated using Tides and Currents for Windows software from Nautical Software, Beaverton, Oregon, U.S.A.

RESULTS

The temperature and salinity data recorded during this study are presented in Table 2. Table 3 lists the fifteen species of fish identified in the catches and their abbreviations. Table 4 gives the total fish catch for each beach seine and pole seine set. The results of the scale analysis may be found in Table 5. Table 6 lists the fish length, fish weight, stomach content weight, estimate of fullness and percent digestion of the stomach contents for each fish. The results of the analysis of the stomach contents may be found in Table 7. The organisms identified in the epibenthic sleds and their abbreviations are presented in Table 8. The numbers of organisms m^{-2} in the epibenthic samples are listed in Table 9.

ACKNOWLEDGMENTS

We are grateful to Rob Russell, Barry Lawley and Jeff Armstrong, Habitat and Enhancement Branch (HEB), South Coast Division, Nanaimo, B.C., who carried out the beach seining during May, 1993. Bruce Hillaby (HEB) made the field work possible by providing advice, equipment and assistance to collect the samples. He also initiated and funded the diet analysis of the juvenile chinook. Mary J. Hudson carried out the laboratory analysis of the epibenthic sleds. The scale samples were read by the Ageing Laboratory at the Pacific Biological Station in Nanaimo, B.C. Financial assistance for some of the field and laboratory work was provided by Fisheries and Oceans Canada Habitat Action Plan, Environment Analysis component, arranged by Dr. Colin Levings, Science Branch, West Vancouver Laboratory. Dr. Glen Jamieson, Science Branch, Pacific Biological Station, first suggested the study.

Table 1. Location of sites sampled for physical characteristics, fish and epibenthos.

Site No.	Description
1.	Situated at the south end of the man-made dogleg slough on the eastern shore.
2.	At the mid-point of the man-made dogleg slough on the western shore.
3.	Located at the north end of the man-made dogleg slough on the western shore.
4.	A site in a small pool west of the breach in the dyke.
5.	Northeast of the breach in the dyke.
6.	Located on the end of the spit on the west side of the estuary.
7.	In the upper reaches of the salt slough on the east side of the estuary.
8.	At the lower end of the salt slough on the east side of the estuary.
9.	Located on the east side of the estuary inside the point.
10.	Situated on the marine foreshore of the spit at the mouth of the estuary.
11.	On a sandbar at the mouth of the river.
12.	A site beside a large stump in a shallow slough east of the dyke.
13.	Located southeast of site 12 in the same shallow slough east of the dyke.
14.	Southeast of site 13 in the same shallow slough east of the dyke.
15.	Situated at the east end of a small slough branching from the northern end of the dogleg slough.
16.	Located on the northern bank of a pool connected to the dogleg slough by a small channel.
17.	A site at the midpoint of the channel connecting the estuary and the dogleg slough.
18.	In the upper most reaches of the salt slough on the east side of the estuary.

Abbreviation	Epibenthos
AMPH	Amphipods
BCYP	Barnacle cypris
BIVA	Bivalves
BNAU	Barnacle nauplii
CALA	Calanoid copepods
CHIL	Chironomid larvae
CAJU	Calanoid copepod juveniles (copepodites)
CLAD	Cladocerans
CNAU	Copepod nauplii (calanoid, cyclopoid, harpacticoid)
COTT	Cottid fish
CRME	Crab megalops
CUMA	Cumaceans
CYCL	Cyclopoid copepods
DECA	Decapods
ECTO	Ectoprocts
EGGS	Unidentified eggs
EGSA	Egg sac
FIEG	Fish eggs
FILA	Fish larvae
GAEG	Gastropod egg cases
GAST	Gastropods
HARP	Harpacticoid copepods
INSE	Insects
INSL	Insect larvae
ISOP	Isopods
LARV	Larvacea
MEDU	Medusae
MITE	Mites
MYSI	Mysids
NEMA	Nematodes
OSTR	Ostracods
POLY	Polychaetes
ROTI	Rotifers
TANA	Tanadaceans
TARD	Tardigrades
TOTL	Total
TUNI	Tunicates
WORM	Unidentified worms
